

OBSERVE

When your power transformer's health issues remain evident, but symptoms seemingly come and go, extended oversight may be required to catch lurking issues at play.

Providing a similar, yet more elaborate arrangement of advanced technologies than those deployed during the **SCREEN** phase, our **OBSERVE** overnight baseline testing services allow our certified specialists to watch your transformers for extended

fault activity recording. As we log data during a 24-hour observation period, we can capture harmful issues as they occur.

After the 24-hour observation period concludes, Transformer Clinic™ specialists review all compiled inspection data to quickly issue operators an easy-to-understand summary of their findings, correlation with operating parameters in addition to their power transformer's condition ranking.

OBSERVE

Transformer Clinic's™ powerful condition ranking summary is amongst the most comprehensive reports available in the industry. We synergize results from a multitude of advanced and conventional inspection methods, in addition to technologies that help maintenance operators confidently make better and more informed decisions in their efforts to improve the in-market availability of their power transformers.

In the event your power transformer's symptoms require further analysis, or if you're simply being proactive, Transformer Clinic's™ **MONITOR** solutions provide your transformers with continuous, real-time, and around-the-clock health and condition monitoring to offer you ultimate peace-of-mind.
